

Abstract of the Disclosure

A high-speed object washer may be provided for receiving a plurality of objects at an entrance portion, engaging a retention turntable and progressing into a cover. While traveling in the cover in a rotary direction, various cleaning operations may be performed to the object in order to remove various contaminants. After traveling in the rotary direction under the cover, the object may egress from the object washer at an exit portion. The object egresses from the exit portion clean and contaminate-free.
